SUMMARY

Software engineer with 4 years building production systems at an insurance carrier, where I rearchitected the data-access layer now used by 10+ developers across multiple teams. I ship full-stack AI products end to end, including a live Google Play app and an AI lecture platform built on a crash-tolerant serverless pipeline.

TECHNICAL SKILLS

Languages: TypeScript, C#, Python, Java, JavaScript, SQL, Kotlin, Swift

Backend & Data: .NET, Node.js, Express, Django, PostgreSQL, SQL Server, Prisma, REST APIs

Frontend & Mobile: React, Next.js, React Native, Expo, Tailwind CSS, Vite

AI & Cloud: OpenAI API, Anthropic Claude, AWS Bedrock, Google Gemini, AWS, Vercel, Stripe

Practices: CI/CD, Git, Monorepos (Turborepo), Automated Testing, Docker, Agile

EXPERIENCE

Investors Heritage

Louisville, KY

Software Developer

May 2025 – Present

Software Developer Intern

May 2022 – May 2025

- Rearchitected the backend data-access layer into a centralized database class and dynamic query builder, replacing scattered raw SQL with composable, maintainable methods (offset/fetch pagination, dynamic filtering); **adopted as the company-wide standard and now used by 10+ developers across multiple teams.**
- Build and ship features across a production .NET platform used daily by **1,000+ insurance agents and internal staff**, spanning backend services, database design, and agent-facing interfaces.
- Write and optimize complex SQL queries and CRUD operations powering features such as policy-history tracking, eliminating redundant database calls and improving response times across internal tools and agent-facing pages.
- Designed and deployed automated batch jobs, including a monthly void-policy report emailed to agents that replaced a hand-built manual report, **in production use for 2+ years.**

PROJECTS

Chalk: AI Lecture Capture Platform

Solo · 2026

TypeScript, Next.js 16, React 19, Groq + OpenAI, Neon Postgres, Vercel Blob, Stripe, LTI 1.3, Expo · chalkrecap.com

- Built and launched a serverless media pipeline that turns a recording, upload, or video link into navigable chapters, study notes, quizzes, and a tutor citing clickable timestamps, with **82 API routes** serving a web app and an Expo mobile client.
- Engineered the pipeline to survive platform timeouts: audio is chunked and each chunk checkpointed to Postgres, with an atomic claim lock and a cron sweeper reviving runs killed by the 300-second function ceiling, so a **crashed job resumes without re-paying for transcription.**
- Eliminated LLM timestamp drift of up to 100 seconds by having the model return verbatim transcript quotes, then resolving true chapter times against the source.
- **Cut transcription cost roughly 10x** by routing it to Groq behind an OpenAI-compatible fallback and tiering language models by task; wired Stripe metered billing, LTI 1.3 launch from Canvas/Moodle, and Zoom/Webex OAuth import.

RoamKit: Offline-First Travel Toolkit

Solo · 2026

React Native, Expo, Expo Router, RevenueCat, EAS, AsyncStorage

- **Shipped to the Google Play Store.** One Expo codebase deploying to iOS, Android, and web, with 10 utilities that all function with zero connectivity.
- Designed a three-tier offline-first data store (bundled snapshot, on-device cache, live refresh) that **cut network usage to roughly one call per day** while always labeling data freshness.
- Integrated RevenueCat in-app purchases for a one-time Pro unlock; passed a 14-day closed beta and Google Play production review.

RayHealth EVV: Medicaid Compliance Platform

2-engineer team · 2026

TypeScript, React, Node.js, Express, PostgreSQL, Expo, Turborepo, AWS Bedrock · rayhealthevv.com

- Co-built a HIPAA-aligned Electronic Visit Verification platform as a **4-workspace Turborepo** (shared domain core, Express API, React admin console, Expo caregiver app) with **1,081 tests** behind required CI gates.
- **Owned the caregiver mobile application end to end:** GPS-verified clock-in/out, an offline store-and-forward queue that survives dead zones, e-signature verification of service, push/SMS notifications, in-app training, and identity verification.
- **Built the claims and billing transport:** 837P X12 claim submission with automated 835 remittance ingest, plus scheduled visit submission to state Medicaid aggregators (Sandata, HHAExchange).

Also: Helix Studio (helixstudio.org), a multi-agent AI software engineering platform built with a partner; Next.js 16, 93 API routes, model-routed Anthropic + OpenAI agents.

EDUCATION & CERTIFICATIONS

University of Louisville, J.B. Speed School of Engineering

Aug 2021 – May 2025

Bachelor of Science in Computer Science · Louisville, KY

HackerRank Certifications: Software Engineer · Software Engineer Intern · Problem Solving (Basic)
